- 2. The installed and working machine capacity of the power plant in the mineral oil plant was 14,300 km in 1950. However, the power plant can only be operated on a capacity of 12,000 to 16,000 km, because various boilers are badly in need of repair, and because there is a disproportion between the installed boiler capacity and the installed turbine capacity.
- 3. Schedules for eliminating the disproportion between the boiler capacity and the machine capacity have been worked out in the Five-year-Plan. According to these plans, the 1951 expansion of the power plant will guarantee a capacity of 30,000 kw. The scheduled expansion will allegedly increase the capacity to about 40,000 kw in 1952 and to 50,000 kw in 1953. 30,000 kw of this installed capacity of 50,000 kw could be transferred to the public system by the end of 1953.
